## Annual Review for the Year 1977 Volume 21

### ACTIVITY REVIEW — MONTANA 1977

Gas production in Montana continues to increase. Total for 1977 was 47,234,941 MCF, up by 3.02 billion cubic feet over last year's gas withdrawals of 44,212,874 MCF. The bulk of the increase is due to new well production as well as the continued process of placing shut-in wells on stream as upgraded facilities become available. Marketed associated gas in 1977, which is included in the total shown above, also increased over last year's associated gas production by 271,071 MCF. This is mainly the result of a concerted effort to conserve all gas produced with oil where economically feasible.

Montana's oil production for 1977 was 32,680,054 barrels, down by 134,206 barrels as compared to the total for 1976. Although 1977 overall oil production decreased, two specific areas had substantial increases.

Oil output from the Powder River Basin Area has steadily increased since 1975 and was up by 302,598 barrels over 1976. A successful secondary recovery program at Bell Creek, a major field in the basin, is the primary factor in this increased production.

The high success rate of active exploratory and development drilling in the Williston Basin portion of eastern Montana has also increased the total production from this area over the past two years. Oil is from pay zones in the deeper Paleozoic reservoirs. As compared to the total 1976 output, oil production was up by 125,255 barrels in 1977.

There were 678 wells drilled in Montana in 1977, 109 less than in 1976. The number of exploratory and development wells drilled were down by 76 and 33 wells respectively. Weather and rig availability were responsible for a portion of the drilling decline. The 172 wildcats drilled included 11 oil and 7 gas new field discoveries and 17 new pay or significant field extensions. A total of 506 development wells resulted in 220 gas and 98 oil completions.

The potential of major reserves of oil and gas along the Overthrust Belt of western Montana continues to accelerate activity in this area. A December 1977 sale brought the highest bonus total in nine years at the Montana State lands sale. More than 60% of the total tracts offered were in the Overthrust Belt area. Considerable interest was also shown in subsequent state land sales in March and June.

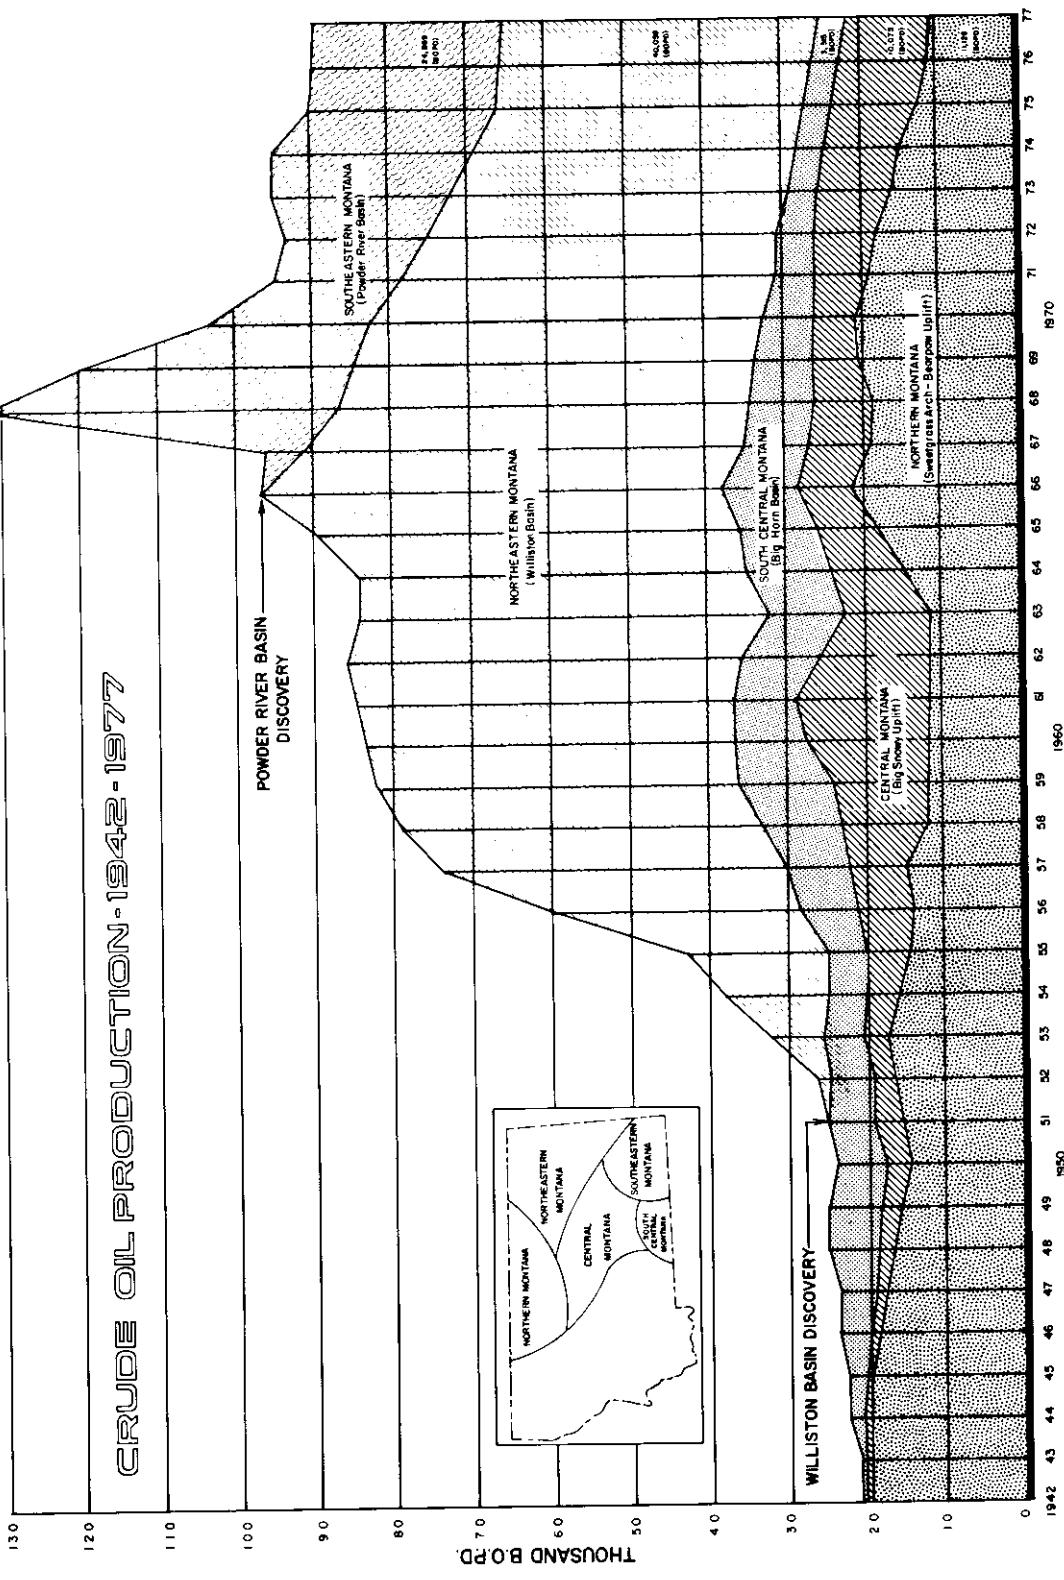

The outlook for future oil and gas development in Montana is good. Emphasis will primarily be on the Overthrust Belt area as well as the shallow Cretaceous sand gas reservoirs of north central and northwest Montana. The high success rate of active exploratory drilling in the Williston Basin portion of eastern Montana is also expected to continue to generate more drilling along this flank of the basin with similar success.
