## Annual Review for the Year 1981 Volume 25

### ACTIVITY REVIEW — MONTANA 1981

A record number of 1,149 wells were drilled in search of oil and gas in Montana during 1981, an increase of 197 over the last year. A total of 552 wildcats, also a record, and 597 development wells resulted in 402 oil and 218 gas completions. The completed wildcats included 29 oil and 5 gas new field discoveries, three development wells encountered new pay zones and 25 were significant field extensions.

Continued aggressive geological and geophysical exploration programs now being pursued show that the interest in Montana's potential oil and gas reserves is high, and the future outlook for the drilling and development of these reserves remains good.

Oil production was up by more than 1.2 million barrels over last year's total output, 30,813,412 barrels as compared to 29,583,804 barrels for 1980; the first reversal of a steady decline of Montana's yearly oil output since 1973. This is mainly the result of a substantial increase of oil production from the Williston Basin area of Eastern Montana where 19.95 million barrels of oil was produced, exceeding the 1980 oil output from this area by more than 2.2 million barrels. This upturn of oil production also reflects the high success rate of active wildcat and development well drilling in the Williston Basin during 1981, where the number of producing wells has increased from 996 in 1980 to 1,080 in 1981.

Total gas production for 1981 was 50.1 billion cubic feet, 3.7 billion cubic feet less than last year's total gas withdrawals. Marketed associated gas which is included in the yearly total and is produced with the oil from the deeper carbonate pays in the Williston Basin portion of Eastern Montana continues to increase however, and at 5.2 billion cubic feet was up by 463 million cubic feet over 1980's associated gas production.

Exploratory and development drilling can be expected to continue in Northern Montana to test the comparatively shallow gas and oil reservoirs in this area where oil production increased by 88,400 barrels in 1981. Active leasing, expanded exploration programs and drilling demonstrate the continued interest in the major oil and gas reserves expected to underlie Western Montana's Overthrust Belt. Several deep wildcats are drilling and others are reportedly planned.

The Board of Oil & Gas Conservation is designated by 82-11-113 MCA as the Montana jurisdictional agency to administer the Federal Natural Gas Policy Act of 1978 for state and fee lands. For each of the three years, 1979 through 1981, the Act has been in effect, the Board's Administrator and Geologist processed and made determinations on totals of 328, 273 and 273 N.G.P.A. applications. A summary of the 1981 Docket determinations is as follows: 256 qualified, 2 withdrawn, 9 pending additional documents, and 6 deferred until additional monthly production was available. Of the 273 N.G.P.A. (FERC) applications submitted, 96 were for new onshore well (Category 102-2 - 2.5 mile test), 1 new onshore well (Category 102-3 - 1,000' deeper test), 47 new onshore reservoir (Category 102-4), 93 new onshore production well (Category 103), and 36 stripper well (Category 108).

A record 164 orders were issued by the Board during the year, 25 more than in 1980. The greater portion of which included requests for drilling and spacing units, pooling of interests, unitizations, establishing field delineations and field spacing rules, exceptions to spacing rules and the inclusion of shallower and deeper pay zones into field rules; and 19 were administrative orders that regulate the disposal of produced water for the protection of fresh water resources. (CGM-1982)
